<b>Abstract</b>	<i>The protected areas represent – according to the opinion of many specialists – the main component of national and international strategies concerning the preservation/protection sustained by the governments and specialized organisms. As a result of the expansion of this country, in China many forms of tourism begin to be practiced, some of them modern such as extreme sports and even ecotourism which means that the Chinese authorities understood the importance of preserving the tourism resources of which the future generations will benefit, especially if the touristic fluxes to China will intensify. On the other hand, the population of China has learnt that they can take advantages from practicing the ecotourism as a part of the incomes earned go to the local economy, leading to its development. In the last years China created a complex national network of the natural reservations with a rational distribution and a solid function.</i>
